**Good luck!**

**Question 1: [7 Marks]**

Consider a rapid test to determine infection with a certain disease. We know that someone who has the disease will be correctly diagnosed 96% of the time. Someone who does not have the disease will be falsely diagnosed, a false positive, 2% of the time.

The disease is prevalent in 0.4% of the population.

- |   |    |
|---|----|
| a) A patient takes a test. Calculate the probability that they will get a positive result.  | /3 |
| b) The test result comes back positive. Calculate the probability that the patient has the disease given that they got a positive result. | /4 |

**Question 2: [7 Marks]**

When you play roulette at a casino, we can bet on one of the 37 numbers from 0 to 36. Alternatively you can bet on the colour red or black (0 is coloured green).

For the remainder of the question, consider a bet of €100.

- a) If you bet on red and the ball falls on one of the 18 red compartments, your money is doubled.

/3

Calculate the Expected value of the random variable  $X$  : « amount won betting on red ».

- b) Compare this value with the Expected value of the random variable  $Y$  : « Amount won betting on a specific number ». If the ball stops in the compartment you have bet on, you receive 36 times what you bet.

/4

**Question 3: [11 Marks]**

From a group of 10 runners and 15 non-runners, a university researcher selects 5 people for a study on cardio-vascular disease.	
a) How many groups is it possible to make if we make no distinction between the runners and the non-runners?	/3
b) How many groups is it possible to make if we want exactly three runners participating in the study?	/4
c) What is the probability that, given a random selection of participants in the study, that there would be exactly three runners in the group?	/4

**Question 4: [14 Marks]**

Consider the function $f$ defined by $f(x) = -\frac{x^3}{3} - \frac{x^2}{2} + 6x + 4$ .	
1) Determine an expression for $f'$ , the derivative of the function $f$ .	/4
2) Study the sign of $f'$ (make a sign table).	/6
3) Determine the interval in which the function $f$ is increasing.	/4

**Question 5: [16 Marks]**

The function,  $f(x) = 60\cos\left(\frac{2\pi}{30}(t - 15)\right) + 75$  can be used to model the height of a passenger above the ground on the London Eye, where  $t$  is the time in minutes after departure.

- |   |    |
|---|----|
| a) Determine the period of the London Eye.  | /2 |
| b) Determine the amplitude of the London Eye.   | /3 |
| c) Use this function to estimate the height of a passenger 18 minutes after departure.          | /2 |
| d) What height above the ground is the boarding platform?                                       | /3 |
| e) Sketch the graph of the function $f(x)$ .  | /3 |
| f) Use your graph to estimate how long a passenger would spend more than 100m above the ground. | /3 |

**Question 6: [10 Marks]**

Below are three functions labelled A, B, C, D and E and their derivatives labelled I, II, III, IV and V. Match each function to its corresponding derivative.

		/10
A	I	
B	II	
C	III	
D	IV	

**E**

**V**
